

Your safe working environment with Lockout-Tagout-Systems (LOTO)

CAUTION!

Many accidents occur during maintenance, inspection, repair and cleaning services on components and plants. This can be prevented by modern safety precautions. **Lockout-tagout systems (LOTO)** offer an effective solution for carrying out maintenance and service work more safely.

What are lockout-tagout systems?

Lockout-tagout systems, also known as „LOTO“, are **systematic interlocking and blocking systems** that are fitted to components. They help to keep hazardous energies such as hydraulic pressure, electrical energy or compressed air under control during service activities. By using LOTO systems, **risks** such as serious accidents and cost-intensive system damages **can be minimized** by ensuring that plants cannot be started accidentally during work. The principle:

**LOCK
OUT**

**TAG
OUT**

In a **lockout**, **locking devices** are fitted at energy disconnection points to switch off the plant and prevent it from being restarted.

During **tag-out**, a **warning tag** is displayed which clearly indicates that the plant must not be operated and contains all relevant information on the lockout.

Protected working.

Take advantage of our advice and LOTO-compatible AWH solutions

We offer the corresponding LOTO security solutions for the classic AWH stainless steel components. We provide advice and support for implementation in your company. Protect your employees and systems - contact us for customized solutions!
